

## Magnetic lock SSM140

### **Magnetic lock SSM140 for Wertheim Deposit boxes**

The magnetic sliding lock works on the basis of ceramic permanent magnets. The magnetically coded key inductively controls the lock circuit. Each box lock has a locking circuit for the bank lock and the customer lock. The rotor system of the circuits is invisible from outside and also inaccessible. Blanking or unlocking is not possible. The magnetic lock operates without wear and is not sensitive to the climate.

#### **Automatic Bank Lock:**

Each box has a double lock with the same bank lock for the entire system with a one-of-a-kind unique customer lock.

Bank key and customer key are inserted into the common key slot for locking. By pushing the key pair to the right, the lock is unlocked.

The bank key can be removed when the lock is opened. To lock the double lock, the customer key is sufficient - it also automatically locks the bank lock.

The bank employee is therefore only involved in the unlocking process. Only after proper locking of the double lock, the customer can remove his key.

#### **Keys:**

As standard equipment for each installation, we supply 2 bank keys and 2 unique keys customer keys for each box, as well as a plastic key protector.

Each key is registered with Wertheim and can be reordered at any time, upon submission of a written order from the owner.
