

Compartment lock - SSE 120

The SSE 120 safe lock forms a solid enclosure in conjunction with the locker construction. A number of design details reveal the care taken in the development of this complete unit.

Cable routing: From the lock to behind the door hinge cover, the cable routing is covered with an aluminium profile and form-fitting plastic profiles making it invisible to the user.

Tampering: The lock cannot be dismantled without permanent visible damage. The screw covers are pressed in and can only be removed by destroying them. Any tampering is therefore immediately detectable.

Cylinder replacement: The cylinder can be removed by loosening the Allen screw on the lock cylinder. The new cylinder is fitted in reverse order.
